

MILESTONE 1

Project Proposal

The first step in the UX journey. A clear proposal keeps the project focused and builds toward a meaningful solution.

Project Title

StudyMate — A Subject-Wise AI Chat Assistant for Students

Problem Statement

General AI chat tools like ChatGPT work fine, but they aren't built around how a student actually studies. Everything goes into one long, mixed conversation, with no sense of level or subject, and the same interface is given to a Class 10 student and a BCA student even though they need very different kinds of answers.

Why This Project?

Students need quick, level-appropriate academic help that stays organized. Without this, revising for one subject means scrolling through an unsorted mix of every past conversation.

Target Users

Students from school level (Class 10) up to bachelor's programs (BCA, BSCSIT, BIT and similar) who want quick, level-appropriate academic help without digging through one long unsorted chat.

Objectives

Let students pick their grade or program first so the app shows only relevant subjects. Keep each subject's conversation separate. Support asking a question by typing, speaking, or sharing a photo.

Expected Features

Level/program selection screen · subject list that updates automatically · separate chat thread per subject · type, speak, or photo input · syntax-highlighted code blocks · searchable sidebar grouped by subject · save-as-note option · light and dark mode.
