

Design Opportunities

Navigation

Level selection is a flat list right now — Class 10 and below, +2 Science, +2 Management, +2 Law, +2 Humanities, BCA, BSCSIT, BIT, BBA, BBS, BE Computer, BSc Physical Science — all sitting at the same level with no grouping. I noticed this across competitor apps too: none of them group levels in a way that matches how students actually think about where they belong.

Fix: Group into tiers — School / +2 / Bachelor's — with the specific tracks nested as sub-tracks under each tier. I've already defined a subject color system — green for Technology/Computing, blue for Management/Commerce, purple for Science/General — but I haven't applied it to the subject cards yet.

Fix: Apply the three-family color system as left-border accents on subject cards, without letting it override the navy/gold brand dominance.

Chat Experience

User and AI chat bubbles look visually identical right now. Fine for a short exchange, but it makes longer threads harder to scan.

Fix: Give user and AI bubbles distinct visual treatment. Code blocks and the "Save as Note" button also don't have any distinct styling yet — they blend into the rest of the chat.

Fix: Style code blocks in IBM Plex Mono, and give Save as Note its own visual identity.

The empty chat screen has no scaffolding — it's just a blank input box.

Fix: Add suggested prompt chips to the empty chat screen to cut down first-message friction.

Brand & First Impressions

The navy/gold identity is strong through splash and onboarding, but it drops off once a user reaches the main app shell — it's not carried into headers, active states, or accents.

Fix: Extend the navy/gold system consistently into the app shell, not just onboarding.

Sequencing

Not all of these carry the same weight. Two are structural — they affect the app's information architecture, and everything else builds on top of them:

1. Tiered level selection redesign

2. Subject color-coding applied to actual subject cards

The rest are surface-level fixes that make more sense once the structure is settled:

- Chat bubble differentiation
- Code block + Save as Note styling
- Brand carry-through past onboarding
- Suggested prompt chips on empty chat
- Login copy fixes

Starting with tiered level selection makes sense — subject color-coding and the rest of the chat experience both sit downstream of it.
