StudyMate — Nepal Academic AI Assistant

I picked three people I actually know at three different academic levels — school, +2, and bachelor's — because StudyMate isn't built for one kind of student. A Class 10 student, a +2 student cramming before exams, and a BCA student working through technical coursework all need very different things from the app, even though they're using the same product. These personas are based on their real study habits, not made-up ones, so the design decisions I make later (tiered levels, subject color-coding, chat structure) actually trace back to real behavior instead of guesses.

Sanish Basnet

19 years old | BCA

How they study

Studies mostly on his phone, in short bursts whenever he gets time between classes or at home, rather than sitting down for one long session. Juggles several technical subjects at once — programming, DBMS, networking — so he's constantly switching context.

What frustrates them

Because he's dealing with multiple technical subjects at the same time, everything ends up mixed into one long, messy chat history when he uses a generic AI tool. Finding that one DBMS query explanation from two weeks ago means scrolling past a dozen unrelated conversations.

What they need from StudyMate

Subject-isolated chat history so his BCA coursework stays organized subject by subject, code that actually reads well on a small phone screen, and a way to save important explanations as notes so he doesn't have to re-ask the same thing before exams.

Aananda Raj Basnet

16 years old | +2

How they study

A night studier — most of his real studying happens late, close to exams, in cram sessions rather than spread out evenly through the term.

What frustrates them

When he's cramming at night before an exam, he doesn't have time for long, generic explanations. Most tools either over-explain or make him dig around before giving him a straight answer, which wastes time exactly when he has the least of it.

What they need from StudyMate

Fast, direct answers per subject with no wasted words, a low-friction way to just start typing without having to figure out how to phrase the first message, and a quick way to save key points for last-minute review.

Sam Dahal

14 years old | Class 10

How they study

Also a night studier, also exam-driven like Aananda, but younger — his subjects are more foundational and general rather than specialized.

What frustrates them

Most study tools are built with older or college-level students in mind. If StudyMate feels too technical or complicated, it stops feeling like it was made for him. His subjects also don't cleanly fit into the Tech, Management, or Science color families the app uses at higher levels.

What they need from StudyMate

Simple, age-appropriate explanations for his subjects, an interface that doesn't feel like it was designed for a college student, and clear subject organization even though his subjects sit outside the three-color system.
