

StudyMate

Information Architecture

Why I structured it this way

StudyMate is meant for students from different education levels, so I didn't want everyone to see the same long list of options.

For example, a Class 10 student and a BCA student will have very different subjects and study needs. Because of that, I grouped the education levels into School, +2, and Bachelor's first.

The main flow: Level → Subject → Chat

Each subject also has its own conversation history so that chats from different subjects don't get mixed together.

1. Full Hierarchy

StudyMate	
Onboarding	Splash / Logo; Login; Sign Up
Level Selection	School → Class 10 and below +2 → Science, Management, Law, Humanities Bachelor's → BCA, BSCSIT, BIT, BBA, BBS, BE Computer, BSc Physical Science
Subject Selection	Subjects change depending on the selected level Subject cards use different color accents
Chat	Empty state; Suggested prompts; Student message; AI response; Code block; Save as Note; Typing indicator; Voice input; Photo upload
Sidebar / Chat History	Chat history grouped by subject
Settings	Account; Appearance; Chat Preferences; Support

2. Navigation Logic

The first important choice is the education level. Students select School, +2, or Bachelor's and then see the options related to that level.

I changed this from having one long list of all the levels because it would make the first screen harder to scan. A Class 10 student shouldn't have to look through options like BCA, BBS, or BE Computer just to find their level.

The subject list also changes based on the selected level. For example, a BCA student could see subjects such as Programming, DBMS, and Networking, while a +2 Science student could see Physics, Chemistry, and Biology.

The chat history is separated by subject. This is important because a student might use the app for several subjects, and mixing all of those conversations together could become confusing.

The sidebar gives quick access to previous conversations, so students don't have to go through the level and subject selection again every time.

Settings are kept separate from the main study flow because they are useful throughout the app but aren't part of the actual studying process.

3. Depth Check

Screen	Depth from Home
Level Selection	1
Subject Selection	2
Chat	3
Settings	1

The main study flow takes a maximum of three taps to reach the chat.

I kept it this way because students may open the app for a quick question while studying rather than spending a lot of time going through menus.

4. Open Question

One thing I still need to decide is how to handle Class 10 subjects.

Subjects such as English, Nepali, Social Studies, and Health/Population don't fit as neatly into the three subject color groups I currently have.

The overall structure still works, but before moving to the wireframes, I would need to decide whether to add a neutral color for these subjects or create another subject group.
