

StudyMate

User Flow

I chose these three flows because they cover some of the main things a student would do in StudyMate. They also show different parts of the app: starting a new subject, saving a useful answer, and moving between subjects.

1. Starting a subject chat for the first time

This is the main flow for a new student. They first log in, choose their education level, select a subject, and then enter the chat.

The empty chat screen also includes some suggested prompts. I added these because a student opening the chat for the first time may not know what to ask or how to start.

2. Saving an AI response as a note

This flow is useful when the AI gives an explanation that the student may need again later.

For example, while studying a technical subject, a student might get a useful explanation of a programming concept or some code. Instead of asking the same question again before an exam, they can save that response as a note.

3. Switching between subjects

Students may study more than one subject in the same app, so I wanted switching between subjects to be simple.

Each subject has its own chat history. This means that when a student moves from one subject to another, the conversations stay separate instead of everything being mixed together.
